

ABSTRACT OF THE DISCLOSURE

A method for correcting the date/time values associated with digital images captured by a digital camera includes using a digital camera to capture and store a plurality of digital images and to store an associated initial date/time value
5 for each of the plurality of digital images provided by a real-time clock in the digital camera; and establishing communications between the digital camera and a separate device providing a current date/time value. The method further includes determining a current date/time value in the digital camera, and a difference
10 between the current date/time value in the digital camera and the current date/time value in the separate device; and modifying the initial date/time values associated with each of the plurality of digital images to compensate for the difference between the current date/time value in the digital camera and the current date/time value in the separate device in order to correct the date/time values associated with each of the plurality of digital images.
